## StoryPoint of Fairfield

### STORMWATER MANAGEMENT PLAN

#### Site Description

The proposed project will consist of the construction of StoryPoint of Fairfield, an assisted living facility on Gilmore Road between Hamilton-Mason Road and SR 129. The proposed construction will consist of a new building, associated utilities, parking lots and stormwater management facilities. The current site drains to two separate outlets. The northwestern portion of the site drains to the northwest to a swale that outlets to a ditch along State Route 129 and is tributary to Crawford Run, ultimately draining to the Great Miami River. The remainder of the site drains south to a wetland area between the proposed site and Hamilton-Mason Road, that is tributary to Pleasant Run and also ultimately the Great Miami River.

#### Hydrologic Methodologies

The stormwater detention calculations contained in this report were performed by using the SCS Unit Hydrograph hydrologic method in Bentley's PondPack, Version 10.1 software. Pre-developed and post-developed condition hydrographs were generated for storm frequencies of 1, 2, 5, 10, 25, 50, and 100 year 24-hour storm events using an SCS Type II distribution. Please refer to the drainage maps at the back of this report for a delineation of the drainage areas.

The County requires projects to adhere to the stormwater management requirements provided in the Butler County Subdivision Regulations. These regulations stipulate a critical year storm method where the percent increase in runoff from the 1 year, 24-hour storm frequency determines the critical storm event. The post-developed runoff must be controlled for storms of a frequency between one year and the critical storm so that the rate of runoff does not exceed the peak rate of runoff for a pre-developed, 24-hour, 1 year frequency storm. All storm events greater than the critical year must be controlled such the post-developed runoff rate does not exceed the pre-developed runoff rate for the previous storm event frequency.

The 1 year pre-developed hydrologic volume for the southern watershed (PRE SOUTH) is 0.731 ac-ft. The 1 year post-developed hydrologic volume (POST SOUTH A plus POST SOUTH B plus POST SOUTH UNDET) is 1.594 ac-ft. The difference between the two volumes represents an increase in stormwater runoff of 118%, which corresponds to a 25 year critical storm.

The 1 year pre-developed hydrologic volume for the northern watershed (PRE NORTH) is 0.149 ac-ft. The 1 year post-developed hydrologic volume (POST NORTH) is 0.042 ac-ft. The difference between the two volumes represents a decrease in stormwater runoff of 72%, which corresponds to a 1 year critical storm.

TABLE 1 - Existing Hydrologic Conditions

Tributary Area Name	Area (ac)	CN	Tc (hr)	Q1 (cfs)	Q2 (cfs)	Q5 (cfs)	Q10 (cfs)	Q25 (cfs)	Q50 (cfs)	Q100 (cfs)

#### Applicable Permits

The Ohio Environmental Protection Agency (OEPA) requires projects to capture and treat stormwater for a storm event of 0.75" or less.

The required water quality volume is calculated by the equation:

$$WQ_v = \frac{CPA}{12}$$

Where  $WQ_v$  = water quality volume in acre-feet

$C$  = runoff coefficient,  $0.858i^3 - 0.78i^2 + 0.774i + 0.04$ ,  $i$  = fraction of post-construction impervious surface

$P$  = 0.75 in precipitation depth

$A$  = area draining into the BMP in acres

### Retention Pond A

$$WQ_v = \frac{(0.35)(0.75)(10.047)}{12} = 0.221 \text{ acre - feet}$$

As permitted by the OEPA, 75% of the calculated WQv storage will be provided for wet retention basins, therefore the required WQv is 0.166 ac-ft.

A 3" circular orifice will be used to obtain the required minimum drawdown time of 24. The orifice will be at inv=743.75 and the water quality elevation is 744.05. The orifice provides a 24.25 hour drawdown time for the WQv volume.

### WQV DRAWDOWN GRAPH - POND A

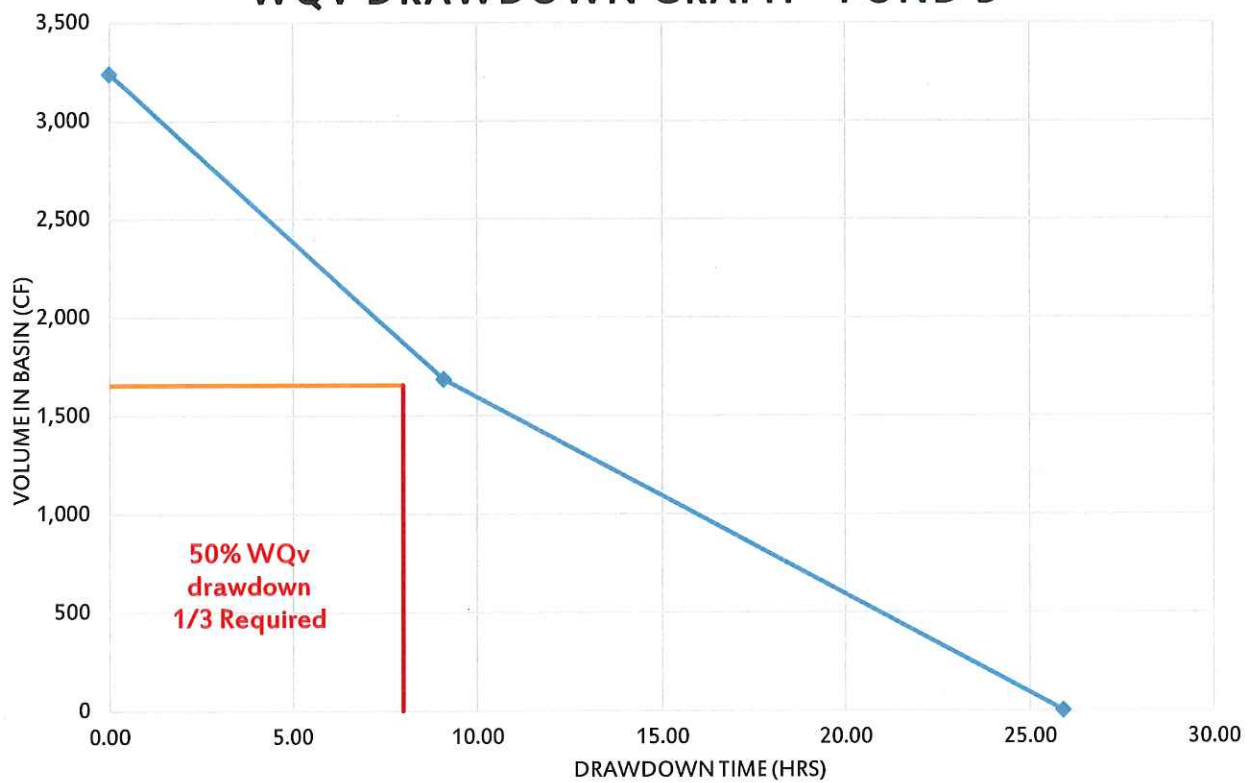

### Retention Pond B

$$WQ_v = \frac{(0.35)(0.75)(4.694)}{12} = 0.101 \text{ acre - feet}$$

As permitted by the OEPA, 75% of the calculated WQv storage will be provided for wet retention basins, therefore the required WQv is 0.076 ac-ft.

A 2-1/8" circular orifice will be used to obtain the required minimum drawdown time of 24. The orifice will be at  $inv=743.75$  and the water quality elevation is 743.96. The orifice provides a 25.92 hour drawdown time for the WQv volume.

### WQV DRAWDOWN GRAPH - POND B

Faint, illegible text, possibly a header or introductory paragraph, located in the upper middle section of the page.

THE PROGRESS OF THE...

Stormwater Management Plan

Stormwater management for the southern watershed (POST SOUTH OUT) will be achieved through detention in 2 retention basins (POND A and POND B), each having a separate tributary area.

The outlet control for POND A will be a 2x3 catch basin (structure 201). The catch basin will have an 8" reverse flow pipe that enters the structure at 742.25. Once inside the structure, the 8" pipe will turn up and be capped at 745.25. A 3" diameter orifice will be drilled into the 8" pipe at inv=743.75 for water quality drawdown. A 15"Wx3"H window will be cut into the north side of the structure at inv=744.05 for control of larger storm events. The grate will be set at 746.00 and will be activated in the 10-year and larger storm events. The 100-year ponding elevation is 746.72. An emergency spillway is provided at elevation 746.75 and the top of bank elevation is 747.75. The spillway will have a 15' bottom with 4:1 side slopes and a berm width of 6'.

The outlet control for POND B will be a 2x3 catch basin (structure 101). The catch basin will have an 8" reverse flow pipe that enters the structure at 742.25. Once inside the structure, the 8" pipe will turn up and be capped at 745.25. A 2-1/8" diameter orifice will be drilled into the 8" pipe at inv=743.75 for water quality drawdown. A 12"Wx3"H window will be cut into the north side of the structure at inv=743.96 for control of larger storm events. The grate will be set at 746.00. The 100 year ponding elevation is 746.02. An emergency spillway is provided at elevation 746.00 and the top of bank elevation is 747.75. The spillway will have a 15' bottom with 4:1 side slopes and a berm width of 6'.

Dear Sir,

I have the pleasure to inform you that your application for the position of [Job Title] has been received and is currently under consideration. We are impressed with your qualifications and would like to invite you to an interview.

The interview will take place on [Date] at [Time] at [Location]. Please bring with you a copy of your CV, a recent passport-sized photograph, and any relevant certificates or references.

If you have any questions or require further information, please do not hesitate to contact me on [Phone Number] or [Email Address].

Yours faithfully,

[Name]

## Results Summary

The northern and southern tributary areas will be detained and adhere to the release rates specified in the Butler County Subdivision Regulations. A summary of the peak flows from each area is presented below for reference.

TABLE 4 – Southern Tributary Area (POST SOUTH A + POST SOUTH B + POST SOUTH UNDET)

Storm Event	PRE-DEVELOPED RELEASE RATES (cfs) (PRE SOUTH)	ALLOWABLE RELEASE RATE (cfs)	POST-DEVELOPED RELEASE RATES (cfs) (POST SOUTH OUT)
