February 20, 2001

Mr. Eric Pottenger
Butler Co. Engineers Office
1921 Fairgrove Avenue
Hamilton, OH 45011

Re: Chesterwood Retirement Community
Phase Three

Dear Eric,

Enclosed is a revised copy of the Construction drawings for the above referenced project.

Please consider these plans for approval.

If you should have any questions or comments, please call.

Sincerely,

A handwritten signature in black ink that reads 'Thomas D. Juengling'. The signature is fluid and cursive, with the first letters of the first and last names being capitalized and prominent.

RE: CHESTERWOOD RETIREMENT
COMMUNITY PHASE III
WEST CHESTER TOWNSHIP

Dear Tom:

This office has reviewed the construction drawings for the above referenced development and feels the following items should be considered for revision.

1. Submit storm sewer calculations for Phase III. Also, I haven't been able to find any detention calculations for the Phase III retention pond. Please send retention calculations too.
2. Provide a typical section of the proposed mounding on the grading plan. It appears a swale may need to be constructed between buildings No. 7 & 8 and along the rear of building No. 7 to the yard drain.
3. A swale looks to be needed in the rear of buildings No. 8 thru 11. Where and how is this runoff to drain?

When these items have been corrected, please submit the revised construction drawings.

Sincerely,

Eric J. Pottenger
Design Engineer

PROJECT 95-79

Chesterwood Phase Three

PAGE NUMBER 1.

Check Spillway Elev. = 986.00 With Pond Elev. = 884.00

$$Q_{10} = C I_{10} A$$

This could be higher, since water will have to travel over the lake.

where $T_c = 19.4 \text{ min.} \Rightarrow I_{10} = \frac{170}{(19.4 + 23)} = 4.43$
(AC) = 9.50 Acres

$$Q_{10} = (AC) I_{10} = (9.50) \times 4.43 = 42.01 \text{ cfs}$$

$$Q_{100} = (AC) I_{100}$$

$T_c = 19.4 \text{ min.} \Rightarrow I_{100} = \frac{300}{T_c + 31} = \frac{300}{19.4 + 31} = 6.46$

$$Q_{100} = (9.50) \times 6.46 = 61.37 \text{ cfs}$$

Try Spillway Elev. = 986.00
Building Elev. = 987.50

Try CB 2-3

T/GR = 985.50

WIN = 984.00

30" INN = 982.38

$$30" @ 1.45\%: Q = \frac{(1.496)}{(2.015)} \left(\frac{4.909}{(0.131)} \right) \left(\frac{1}{0.0145} \right)^{1/2} = 42.91 \text{ cfs} > 42.01 \text{ cfs} \text{ OK}$$

DATE Nov. 1996

PROJECT 95-79

Chesterwood Phase Three

PAGE NUMBER 2

Spillway and Catch Basin out of Pond

From Spillway to Window of Catch Basin = $996.00 - 994.00 = 2'$

From ODOT L&D, Vol. II, pgs. 11-3 and 11-4:

$$Q = CLH^{3/2} \text{ For Window of Catch Basin,}$$

$$\text{where } H = 996.00 - 994.00 = 2'$$

$$C = 3.0$$

$$L = (3.0' + 3.0') = 6.0'$$

$$Q = (3.0)(6.0)(2)^{3/2} = 50.91 \text{ cfs} > 42.01 \text{ cfs.}$$

∴ CB 2-3 will be OK

Design Spillway For $Q_{100} = 61.37 \text{ cfs}$

Building Elev. = 997.50

Spillway Elev. = 996.00

$$Q = 3.33 L H^{3/2}$$

$$H = \left(\frac{Q}{3.33 L} \right)^{2/3} = \left(\frac{61.37}{3.33(27)} \right)^{2/3}$$

$$H = 0.78' < 1'$$

Use 30' Drainage Route For 100 Year Storm.

SPILLWAY ELEV. = 996.00

$$V = Q/A = 61.37 \text{ cfs} \div (27' \times 0.78') = 2.9 \text{ fps}$$

∴ Use Seed.

PAGE NUMBER _____

SUBJECT Check Water Balance of Proposed Pond

Check water balance in proposed pond, assuming clay bottom is impervious.

Reference:

Hydrology and Quality of Water Resources, Hammer & MacKichan, page 126 (Fig. 6-1), page 371, and page 372 (Fig. 8-14)

$$\text{Surface Inflow} + \text{Seepage Inflow} = \text{Outflow} + \text{Seepage Loss} + \text{Evaporation} + \text{Change in Storage}$$

Assume zero if bottom is impervious.

Assume zero if bottom is impervious.

From Fig. 6-1, avg. annual precipitation = 1046 mm = 41.18 inches

From Fig. 8-14, avg. annual evaporation = 867 mm = 34.13 inches

$$\text{Evaporation} = (34.13 \text{ inches}) \left(\frac{1 \text{ ft}}{12 \text{ inches}} \right) (30480 \text{ S.F.}) = 86690 \text{ Cu. Ft. Per Year}$$

Calculate Drainage Area Required to Go Into Lakes To Keep Them Filled:

$$\text{Surface Inflow} = (41.18 \text{ inches}) \left(\frac{1 \text{ ft}}{12 \text{ inches}} \right) (X \text{ Acres}) \left(\frac{70\%}{100\%} \right) (43560 \text{ S.F./Ac})$$

$$\text{Surface Inflow} \approx 86690 \approx (10.62)(X)$$

$$8.16 \text{ Ac.} = X$$

8.16 Acres are Required To Drain Into Lake To Keep It Filled, Assuming It Is Filled At The Start.

Site Area \approx 9 Acres.

SCALE=N.T.S.

GENERAL NOTES

- Item numbers refer to the Ohio Department of Transportation construction and material specifications, and all construction work shall be done according to said specifications of Butler County requirements and standards for subdivisions. When in conflict, the County requirements shall prevail.
- Items that pertain to underground utilities such as watermain pipe, sanitary sewer pipe, water valves and manhole frames and covers, etc., will remain under specifications of the utility serving the area. Storm sewers shall be designed and constructed in accordance with the requirements of the Butler County Engineer.
- All trenches within the right-of-way and 10' utility easement shall be compacted and backfilled in accordance with item 203 and 603 in the state specifications.
- A minimum 10' utility easement shall be shown on the record plat parallel and immediately adjacent to the right-of-way line allowing for installation, operation and maintenance of sewers, water, electric and telephone conduits and any other public or quasi public utility.
- Developer shall be responsible for the installation of conduits for the full width of the public right-of-way at a depth of 36" for use by the electric, telephone and cable TV services. The location of the lines shall be coordinated with utility companies by the developer.
- All electrical transformers shall be located so that they do not interfere with the existing manholes or water main appurtenances.
- Water main materials, valves, fire hydrant, fittings and appurtenances and installation to be as per Butler County specifications using class 53 Ductile Iron as per AWWA C-151 with 4' minimum cover.
- Sanitary sewer materials and installation to be as per Butler County specifications, using ABS 6" pipe, as per ASTM D-2751 with joint specification as per ASTM D-3212, using ABS composite 8" pipe, as per ASTM D-2680 with joint specification as per ASTM D-2235.
- Minimum 10" horizontal, 18" vertical separation between Water Main and Sanitary and/or Storm Sewer.(see note * at left)
- Storm sewer pipe to be A.D.S. N-12 plastic or equal unless otherwise noted on plans. Bedding to be first class. All sewers to be installed as per Butler County specifications.
- Roof drains, foundation drains, and other clean water connections to the sanitary sewer system are prohibited.
- All catch basins with a depth greater than 4.5' shall be provided with steps. Steps shall meet the requirements of ODOT STD. 604 and shall conform to the details as shown on Butler County Standard Drawing MH-1A.
- All buildings to be served by the public sewer system shall be constructed so as to provide a minimum of four feet (4') of vertical separation between the public sanitary sewer, at the point of connection, and the lowest building level served by a gravity sewer connection. In addition, said building level shall be at least one foot (1') above the lowest point of free-overflow (non-sealed manhole cover) upstream of any treatment facility or wastewater pumping facility that receives the discharge from said building. Said minimum service levels shall be recorded on the "As Built" plans for the development which will be kept on file in the office of the Butler County Sanitary Engineer.
- Butler County Water and Sewer Department does not accept any responsibility for the relocation, repair, or replacement of any other utility installed within five (5) feet of the center line of any sanitary sewer main or water main.
- All water main valves to have a minimum depth of 2.5' from proposed grade to the top of the Valve Operating Nut.

*10' horizontal separation from outside edges of water line and sanitary/storm sewer required. If the water main crosses either over or under the sanitary/storm sewer pipe, 18" vertical distance between the outside edges of the water and sewer lines shall be provided. Where water line crosses under the sewer, structural support shall be provided for the sewer pipe to prevent damage to the water main and to maintain line and grade of the sewer pipe. Where 18" of separation is not possible, the sewer shall be either encased or constructed to water main standards for a minimum of 10" on each side of the water main.

SEDIMENTATION CONTROL NOTES

The project has been designed to control erosion and prevent damage to other property. All stripping, earthwork, and grading shall be performed to minimize erosion. Natural vegetation shall be retained wherever possible. The proposed plan will allow almost all eroded materials to be retained on site.

All areas disturbed by the construction of the roadways, ditches and sedimentation basins shall be seeded. Payment will be by the number of square yards disturbed as per the grading plan.

METHOD

Straw bales are to be utilized to create temporary dams to catch the silt. These are to be installed at points where the flow is concentrated.

Surface water is to be directed into these temporary silt basins by means of temporary swales and ditches.

As the installation of the storm sewer progress, straw bales are to be placed at the inlet and outlet of sewers to control the silt.

Payment for the above shall be included in items Excavation, Embankment.

"All sediment and erosion control measures must be visually inspected and the appropriate maintenance and repair actions taken whenever precipitation exceeds 1/2 inch in any 24 hour period."

GENERAL NOTES
EROSION AND SEDIMENT CONTROLS

Vegetative practices
 Such practices may include: temporary seeding, permanent seeding, mulching, matting, sod stabilization, vegetative buffer strips, phasing and protection of trees. The contractor shall initiate appropriate vegetative practices on all disturbed areas within seven (7) days if they are to remain dormant (undisturbed) for more than forty-five (45) days. Permanent or temporary soil stabilization shall be applied to disturbed areas within seven (7) days after final grade is reached on any portion of the site.

Structural Practices
 Structural practices shall be used to control erosion and trap sediment from all sites remaining disturbed for more than fourteen (14) days.

Timing
 Sediment control structures shall be functional throughout earth disturbing activity. Sediment ponds and perimeter sediment barriers shall be implemented as the first step of grading and within seven days from the start of grubbing. They shall continue to function until the upslope development area is restabilized.

Sediment Barriers
 Sheet flow runoff from denuded areas shall be intercepted by sediment barriers. Sediment barriers, such as sediment fences or diversions direction runoff to settling facilities, shall protect adjacent properties and water resources from sediment transported by sheet flow.

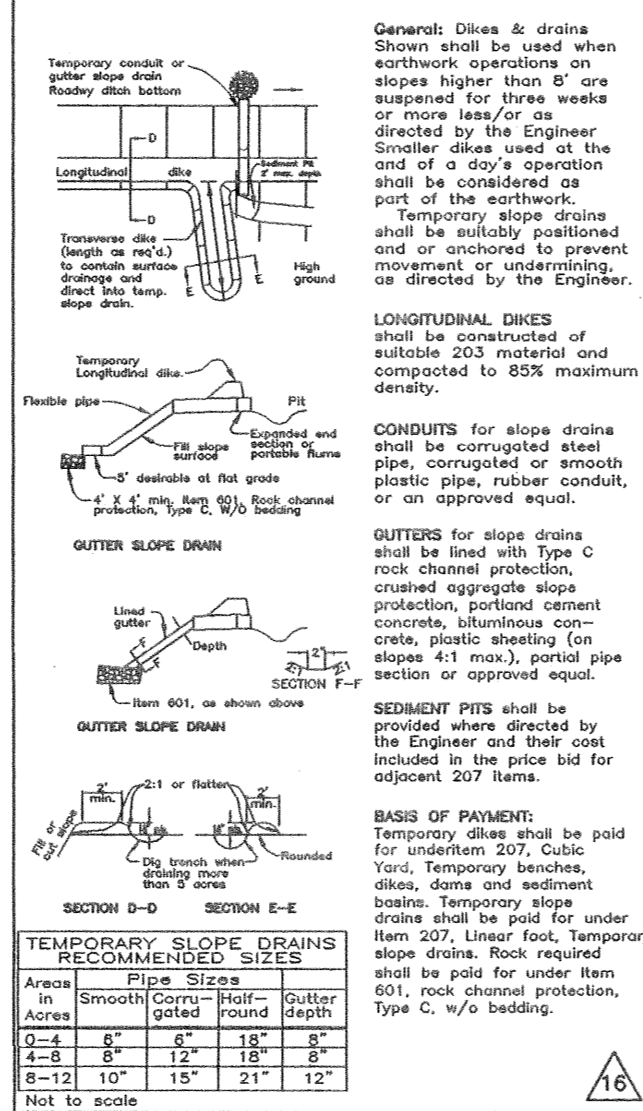

Erosion and sediment control practices used to satisfy the conditions of this plan shall meet the standards and specifications in the current edition of Water Management and Sediment Control in Urbanized Areas (Soil Conservation Service.)

Waste Disposal
 No solid or liquid waste, including building materials, shall be discharged in storm water runoff. Off-site vehicle tracking of sediments shall be minimized. The plan shall ensure and demonstrate compliance and applicable State of local waste disposal, sanitary sewer or septic system regulations.

Maintenance
 All temporary and permanent control practices shall be maintained and repaired as needed to assure continued performance of their intended function.

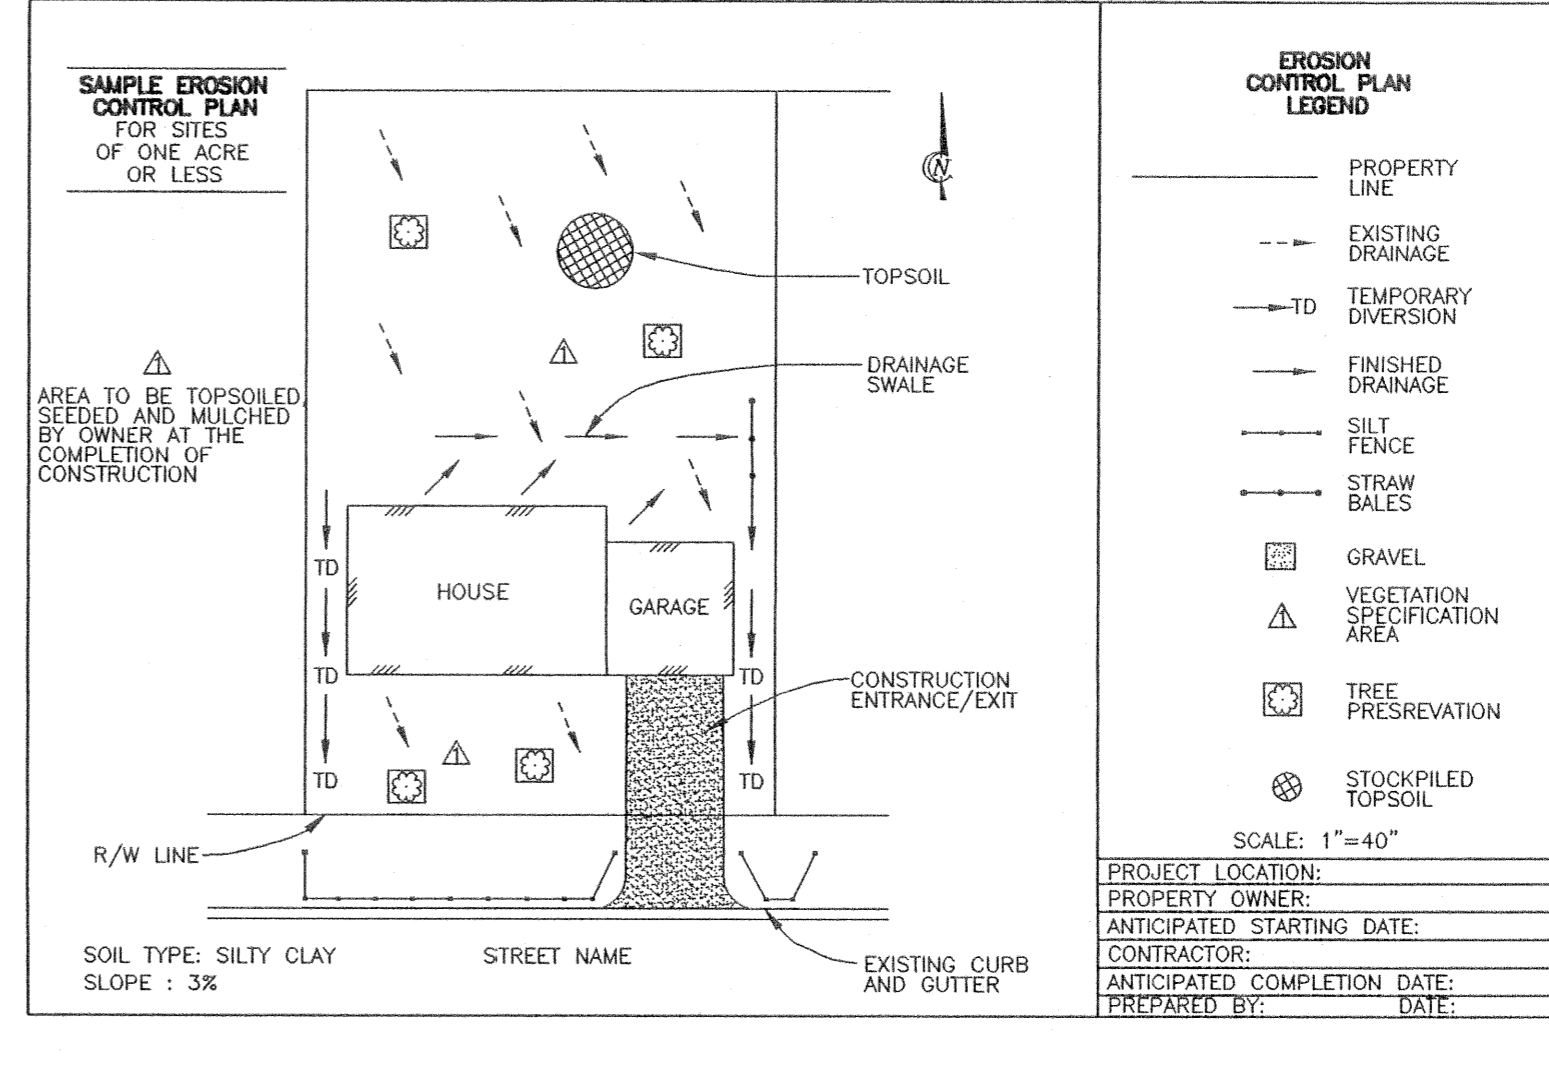

DIKES AND SLOPE PROTECTION

SEDIMENT BASINS & DAMS

EROSION CONTROL FOR SMALL SITES

- REVEGETATION**
 Seed, sod or mulch bare soil as soon as possible.
- SEEDING AND MULCHING**
 Spread 4 to 6 inches of topsoil. Fertilize according to soil test (or apply 10 lb./1000 sq. ft. of 20-10-10 or 10-10-10 fertilizer).
 Seed with an appropriate mix for the site (see table.) Rake lightly to cover seed with 1/4" of soil. Roll lightly.
 Mulch with straw (70-90 lb. or one bale per 1000 sq. ft.).
 Anchor mulch by punching 2 inches into the soil with a dull, weighted disk or by using netting or other measures on steep slopes, or windy areas. Water gently every day or two to keep soil moist. Less watering is needed once grass is 2 inches tall.
- SODDING** Spread 4 to 6 inches of topsoil. Fertilize according to soil test (or apply 10 lb./1000 sq. ft. of 20-10-10 or 10-10-10 fertilizer).
 Lightly water the soil.
 Lay sod. Tamp or roll lightly.
 On slopes, lay sod starting at the bottom and work toward the top. Peg each piece down in several places.
 Initial watering should wet soil 6 inches deep (or until water stands 1 inch deep in a straight-sided container.) Then water lightly every day or two for 2 weeks.

- WARNING!** Extra measures may be needed if your site:
- Is within 300 feet of a stream or wetland
 - Is within 1000 feet of a lake
 - Is steep (slopes of 12% or more)
 - Receives runoff from 10,000 sq. ft. or more of adjacent land
 - Has more than an acre of disturbed ground

Typical Lawn Seed Mixtures

Grass	Sunny Site	Shady Site
Kentucky bluegrass	65%	15%
Fine fescue	20%	70%
Perennial ryegrass	15%	15%

Seeding rate (lb./1000 sq. ft.)
 Seeding rate: 3-4 (Sunny Site), 4-5 (Shady Site)

- SOILING** Spread 4 to 6 inches of topsoil. Fertilize according to soil test (or apply 10 lb./1000 sq. ft. of 20-10-10 or 10-10-10 fertilizer).
 Lightly water the soil.
 Lay sod. Tamp or roll lightly.
 On slopes, lay sod starting at the bottom and work toward the top. Peg each piece down in several places.
 Initial watering should wet soil 6 inches deep (or until water stands 1 inch deep in a straight-sided container.) Then water lightly every day or two for 2 weeks.

- PRESERVING EXISTING VEGETATION**
 Wherever possible, preserve existing trees, shrubs, and other vegetation.
 To prevent root damage, do not grade, place soil piles, or park vehicles near trees marked for preservation.
 Place plastic mesh or snow fence barriers around trees to protect the area below their branches.

STRAW BALE DETAILS

SILT FENCE DETAILS

Source: Installation of Straw and Fabric Filter Barriers for Sediment Control, Sherwood and Wyant

Source: Adapted from Installation of Straw and Fabric Barriers for Sediment Control, Sherwood and Wyant

Source: Adapted from Installation of Straw and Fabric Filter Barriers for Sediment Control, Sherwood and Wyant

- SOIL PILES**
 Located away from any downslope street, driveway, stream, lake, wetland, ditch or drainage way.
 Temporary seed such as annual rye is recommended for topsoil piles.
 Surround with straw bales or silt fence.
- GRAVEL DRIVE**
 Install a single access drive using 3 to 5 inch aggregate over a geotextile material.
 Lay gravel 6 inches deep and 10 feet wide from the foundation to the street.
 Use to prevent tracking dirt onto the road by all vehicles.
 Maintain throughout construction until driveway is paved.
 Park all construction vehicles on the street and off of the site.

- SEDIMENT CLEANUP**
 By the end of each work day, sweep or scrape up soil tracked onto the road.
 By the end of the next work day after a storm, clean up soil washed off-site, and check straw bales and silt fence for damage or sediment buildup.

- DOWNSPOUT EXTENDERS**
 Not required, but highly recommended. Install as soon as gutters and downspouts are completed.
 Route water to a grassed or paved area. Maintain until a lawn is established.
